surfaces can be thought of as deformed versions of the complex plane: locally near every point they look like patches of the complex plane, but the global topology can be quite different. For example, they can look like a sphere or a torus or several sheets glued together. The main interest in Riemann surface

A Riemann surface is a topological space with an atlas of charts to the complex plane \mathbb{C} whose transition functions are biholomorphisms. Any open subset of the Riemann sphere \mathbb{P}^1 is a Riemann surface, as is the complex torus $\mathbb{C}/\mathbb{Z}[i]$.
