A few examples. Here's a few examples of combinations (order doesn't matter) from permutations (order matters). Combination: Picking a team of 3 people from a group of 10.  ${}^C(10,3) = 10!/(7! * 3!) = 10 * 9 * 8 / (3 * 2 * 1) = 120$ . Permutation: Picking a President, VP and Waterboy from a group of 10.  ${}^P(10,3) = 10!/7! = 10 * 9 * 8 = 720$ .

*Permutation And Combination: Definition, Formulas, Practice ...*

This is a combination problem: combining 2 items out of 3 and is written as follows:  $n C r = \frac{n!}{(n-r)! r!}$  The number of combinations is equal to the number of permutations divided by  $r!$  to eliminates those counted more than once because the order is not important. Example 7: Calculate  $3 C 2$   $5 C 5$  Solution:

*Permutations and Combinations Problems*

In mathematics, the notion of permutation is used with several slightly different meanings, all related to the act of permuting (rearranging) objects or values. Informally, a permutation of a set of objects is an arrangement of those objects into a particular order. For example, there are six permutations of the set  $\{1,2,3\}$ , namely  $(1,2,3)$  ,  $(1,3,2)$  ,  $(2,1,3)$  ,  $(2,3,1)$  ,  $(3,1,2)$  , and  $(3,2,1)$  .

*Permutation Combination Formulas, Tricks with Examples ...*

Fortunately, there are formulas that give us the number of permutations or combinations of  $n$  objects taken  $r$  at a time. In these formulas, we use the shorthand notation of  $n!$  called  $n$  factorial. The factorial simply says to multiply all positive whole numbers less than or equal to  $n$  together. So, for instance,  $4! = 4 \times 3 \times 2 \times 1 = 24$ .
